

Business Value Series—JDE Warehouse Management System

Thinking of improving your warehouse accuracy and efficiency? Looking for an increase in capacity while achieving a substantial ROI? Why not think about the JDE Warehouse Management System.

The Warehouse Management System module in JDE is used to effectively and efficiently manage inventory you purchase, manufacture and distribute. With WMS you are able to enhance your workflows to allow a continuous flow of goods while taking advantage of your optimized warehouse layout. The use of putaway, picking and replenishment rules help you achieve unparalleled operational efficiencies.

Implementations result in a significant increase in accuracy, efficiency and overall scalability. Our clients have reported:

- In many cases inventory accuracy has increased to greater than 99% accuracy and have achieved an incredible 80% reduction in picking errors.

An improvement in throughput in your distribution center allows you to increase the volume of sales order picks and purchase order/work order putaways in a day. Our clients have reported:

- Significant reduction in casual labour.
- Training time for new warehouse staff greatly reduced
- Tremendous volume increases without adding any new staff in the warehouse (e.g. 46% volume increase, with no staff addition).
- All orders are now shipped same day.
- Poised to allow additional throughput in the operation while maintaining excellent customer service.
- It helped our distribution and manufacturing operations.
- Putaway of raw materials, work orders and purchased finished goods.
- Picking of work order components, and finished goods (Each, Case & Pallet Picking).
- Replenishment of both our fixed picking locations, as well as our Golden Zone (Picking area).
- Cross docking.
- Allowed us to manage our picking process better, utilizing both order by order picking as well as wave picking.
