Create!email®

Electronic Document Distribution for Create!form Environments

Create!email provides a streamlined solution to the electronic document distribution requirements of your organization. Immediate savings are realized from reduced or eliminated postage, handling and hard copy costs associated with traditional print and mail delivery of business documents.

Without modifying existing applications, Create!email will automatically send your Create!form documents via any SMTP server, existing MAPI (Microsoft® Outlook®) or VIM (Lotus Notes®) application, complete with a personalized message and additional attachments as desired.

Create!email Features

- Automatically distribute your Create!form documents via email in any of the following formats:
 - PDF attachment
 - Embedded text hyperlink within an email body
 - Text in the body of the email itself
- PDF password protection for sensitive data
- Define one or more email recipients, including TO, CC or BCC
- Personalize subject line and email content on the fly
- Automatic log off from the mail application at the end of a job or after an elapsed time as specified by the user
- Optional delivery or notification of failed messages.

How it Works

Create!email utilizes the built-in flexibility of Windows® printing services, allowing spool files from a host system application to be printed to an email port using your application's own print commands.

Information included in a job ticket created with Create!form Director™, is used to identify the email recipient, specify a message template to use, and select the form project for the job. From this information, Create!form Server merges the document with an electronic form that was created with Create!form® and generates a PDF file. The PDF file is then sent to the email client and delivered to the recipient named in the job ticket. A PDF file provides a universally accepted format for electronic document distribution and produces small files (usually 5-10KB per page), resulting in minimal use of bandwidth.

Create!email automatically stores a copy of successfully sent emails in the client's Sent folder and maintains a complete log of Create!email activity on the server. In addition, notification of errors in email transmissions can be sent to any email address.

Any system that is able to print spool files to a Windows server print queue can have its output merged and emailed using Create!email. This includes IBM® iSeries, Windows®, UNIX, VMS hosts and many others. All can easily be configured to take advantage of Create!email's advanced features.

Requirements

Create!email Server

- Windows 2000/2003
- 32 MB RAM
- 10 MB free hard disk space

E-mail Protocols

- Direct interface to any SMTP mail server
- VIM (Lotus Notes 4.6 or later)
- MAPI (Microsoft Outlook and Outlook Express®)

Host-NT Gateways Supported

- All gateways that support print spooling from the host system to the Windows server

Create!form Modules Required

- Create!form Server
- Create!form Director

Output Destinations

Create!email works in conjunction with Create!form's authoring suite to allow, personalized output to be automatically distributed via a number of advanced delivery methods. Each destination is modular – simply choose the modules that your organization needs today, and add on as your requirements change.

Transactional Document Destinations

- **Create!print®** - Output has been optimized for use with PostScript® printers, however your Create!print license(s) will allow you to print to any Windows compatible printer.
- **Create!email®** - Emails document output automatically to recipients in real-time as a PDF attachment, embedded PDF hyperlink or email body text.
- **Create!fax®** - Integrates with fax server software to deliver documents to a fax destination, using fax numbers retrieved from the base document or reference to external ODBC database.
- **Create!archive®** - A digital archive of all your final documents, including full indexing, search and retrieval capabilities.
- **Create!archive Web agent** - Web-enable your archived documents for secure, online Web self-service search and retrieval.

Transactional Payment Destinations

- **Create!form ACH** - Provides secure, NACHA-compliant, electronic payment formatting and transmission for business-critical vendor and employee payments.
- **NetTransact® Express** - Allow your trading partners to pay their Create!form invoices online via Electronic Invoice Presentment and Payment (EIPP).
- **CheckDefense™** - Advanced Positive Pay technology protects your MICR check printing environment from check fraud.
